

Musculoskeletal Trauma

Across

1. the most frequently fractured bone in the body p.193

2. type of fracture that runs across a bones perpendicular to the bones orientation p.174

4. partial displacement of a bone end from its position in a joint capsule p.171

6. a discoloration of the skin resulting from bleeding underneath p.170

14. type of fracture running across the bone at an angle other than 90 degrees p.174

16. type of fracture affecting pediatric patients p.202

18. type of unipolar traction splint p.187

19. an "angina" of muscle tissue p.170

20. complete displacement of a bone end from its position in a joint capsule p.172

Down

3. acute or chronic inflammation of the mall synovial sacs p.177

5. tearing of a joint capsules connective tissues p.171

7. type of fracture where the bone is compressed on its self p.173

8. weakening of done tissue due to loss of essential minerals, especially calcium p.175

9. a syndrome resulting from increased pressure within a confined body space, especially of the leg or forearm p.170

10. of displaced bone ends to their proper anatomical position p.190

11. a solid swelling of clotted blood within the tissues p.170

12. a pelvic fracture site p.191

13. thickened area that forms at the site of a fracture as part of the repair process p.176

15. common soft splint p.186

17. , a fracture of the lower end of the radius in the wrist with a characteristic backward displacement of the hand p.194
