

Unit 5: States of Consciousness

Across

3. psychedelic drugs that distort perceptions and evoke sensory images in the absence of sensory input
9. relatively slow brain waves of a relaxed, awake state
10. chemical substance that alters perception and mood
11. drugs that depress central nervous system, reducing anxiety but impairing memory and judgement

13. drugs that excite neural activity and speed up body functions

14. sequence of images, emotions, and thoughts passing through a sleeping person
15. our biological clock; regular bodily rhythms that occur in a 24-hour cycle
16. drugs that depress neural activity, lessening pain; morphine, heroine

Down

1. large, slow brain waves associated with NREM-3

2. drugs that reduce neural activity

4. periodic, natural loss of consciousness
5. sleep disorder characterized by high arousal and an appearance of being terrified
6. our subjective awareness of ourselves and our environment
7. Rapid eye movement
8. split in consciousness
12. recurring problems in staying asleep
