

Date: _____

[illegible]

- 3. food provides the body with _____ that can be used to make muscles move
- 5. small components that are combined to make large molecules
- 8. The subunit that makes up proteins
- 9. type of compound that our body produces to store extra energy
- 10. a unit of measurement for energy
- 11. large compounds made up of multiple subunits

fats
subunits
aminoacids

1. the set of life sustaining reactions that occur in our bodies when we eat
2. food provides the body with _____ that can be used to replace old tissues in the body
4. proteins that cause reactions to occur, but do not get used up themselves
6. when two subunits combine to make a larger compound _____ is also produced.
7. heavy versions atoms that were used in the rat study

complexmolecules isotopes
enzymes calories
buildingmaterials
