

Date: _____

week 8

Across

2. occurs from injury to a blood vessel wall and formation of a blood clot
7. patient reports this unusual sensation before the seizure takes place
8. occurs when there is ischemia to a part of the brain or hemorrhage into the brain that results in death of brain cells
10. state of continuous seizure activity, a condition in which seizures recur in rapid succession without return to consciousness between seizures, lasts more than 5 minutes

- 11.** disease marked by a continuing predisposition to seizures, with neurobiologic, cognitive, psychologic and social consequences
- 12.** an abnormal sudden, excessive, uncontrolled electrical discharge of neurons within the brain.
- 13.** seizure manifested as a brief staring spell
- 14.** occurs for no known reason and do not fit into the generalized or partial classifications
- 15.** a type of stroke that occurs when it occludes a cerebral artery, resulting in infarction and edema

Down

1. seizure characterized by losing consciousness, falling to the ground, stiffness for 10-20 seconds and subsequent jerking of extremities
3. a result from bleeding into the brain tissue
4. single most important modifiable risk factor for stroke
5. Acronym for warning signs of stroke
6. this nerve can be stimulated to control continuous simple or complex partial seizures
9. a transient episode of neurologic dysfunction caused by focal brain, spinal cord or retinal ischemia but without acute infarction of the brain
