

# Hip and Pelvis

## Across

1. A painful injury caused by a direct blow to the hip, resulting in ecchymosis, tenderness, and swelling; also known as a hip pointer
7. The portion of the pelvis attached to the pubis in front and the ilium laterally in the back; bears the weight of the body when sitting.
8. The portion of the vertebral column between the lumbar vertebrae and the coccyx; composed of five fused vertebrae.
9. A space in the pelvis through which the sciatic nerve travels to the legs.
11. The bone in the pelvis to the front and below the bladder.
14. The upper ridge of the ilium.

## Down

2. A muscle group that aids in adduction of the hip; consists of the adductor longus, adductor brevis, and adductor magnus muscles.
3. The broad, slightly concave inner surface of the ilium.
4. The center of the pubis where the two sides of the pubis are fused together.
5. The large openings in the ischium through which blood vessels and nerves pass to the legs.
6. A muscle group that aids in hip movement; consists of the biceps femoris, semitendinosus, and semimembranosus muscles.
10. A muscle group that aids in flexion of the hip; consists of the iliopsoas, sartorius, pectineus, and rectus femoris muscles.
12. The tailbone.
13. A broad, flared bone that makes up the upper and lateral sections of the pelvis.
