

# Fun with EKGs

## Across

3. An indicator of the atrial rate
7. The heart's natural pacemaker
9. Saw tooth or ocean-like waves
14. Treatment for Ventricular Fibrillation
17. Drug used via rapid bolus for synchronized cardioversion
19. T wave may be inverted in the presence of \_\_\_\_\_
21. An irregular rhythm
22. Distortion of an EKG tracing by electrical activity that is non-cardiac
24. Simultaneous ventricular depolarization
25. Treatment for Torsades de Point
26. Represents the electrical activity of both atria
27. Slowed rate

## 28. Antiarrhythmic drug used in codes Down

1. Represents the time interval from the onset of atrial depolarization to the onset of ventricular depolarization
2. A tachycardia originating above the ventricles, but not from the SA node
4. Not a shockable rhythm due to no electrical activity
5. Regular rhythm with one P per each narrow QRS; rate 60-100 bpm
6. "Quivering" atrial rate of 350-700 bpm
8. Myocardial stimulation, resulting in muscle contraction
10. Duration of ventricular depolarization and repolarization
11. An indicator of the ventricular rate

12. \_\_\_\_\_ is represented by a tall U wave
13. Where most lethal rhythms originate
15. A display of a person's cardiac activity
16. A mnemonic used to aid in remembering the possible causes of cardiac arrest
18. 20% increased rate from baseline HR
20. An electrolyte; when increased may produce cardiac fibrillation
23. An electrolyte; when decreased the patient may have a rapid HR, prolonged QT, and/or ST depression
