Biogeochemical Cycles

Across

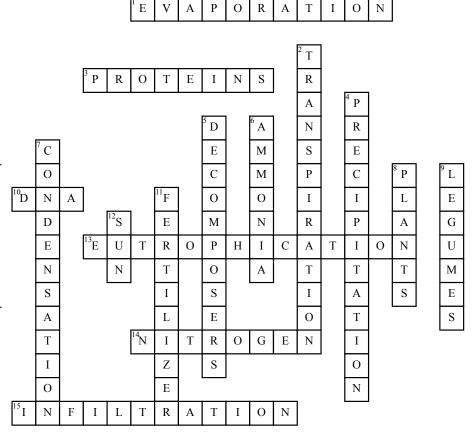

- 1. Process by which water changes from a liquid to a gas.
- **3.** Animals need nitrogen to produce
- **10.** Large organic molecule containing nitrogen that contains your genetic information.
- 13. WW.

occurs when fertilizer runoff causes excess algae and water weeds.

- 14. Our atmosphere contains 78% free
- **15.** The downward entry of water into the soil or rock surface.
- **16.** Prokaryote responsible for "fixing" nitrogen.

Down

- **2.** Process where water "evaporates" from plants.
- **4.** Rain, snow, sleet, or hail.
- **5.** Bacteria that break down organic matter.
- **6.** What molecule is produced when nitrogen is fixed?

 $C \mid T \mid E \mid R$

- 7. Process by which water vapor turns into liquid water.
- **8.** Animals get nitrogen into their systems by eating
- **9.** Oats, peas, beans, corn
- **11.** Helps plants to grow.
- **12.** What "powers" the water cycle?
