Acid and Bases

Across

- **4.** A solution that is neither acidic nor alkaline, such as pure water.
- **7.** A numeric scale used to specify the acidity or basicity of an aqueous solution.
- **8.** Any substance that gives a visible sign, usually by a colour change, of the presence or absence of a threshold concentration of a chemical species, such as an acid or an alkali in a solution.
- **9.** A chemical compound that neutralizes or effervesces with acids and turns litmus blue; typically.

- **10.** Are substances that, in aqueous solution, are slippery to the touch, taste bitter, change the color of indicators.
- **11.** Any chemical compound formed from the reaction of an acid with a base, with all or part of the hydrogen of the acid replaced by a metal or other cation.
- **12.** The monovalent anion OH–consisting of one atom of hydrogen and one of oxygen.

Down

1. The ion H₃O+, consisting of a protonated water molecule and present in all aqueous acids.

- **2.** Is a chemical reaction in which an acid and a base react quantitatively with each other.
- **3.** A solution that resists changes in pH when acid or alkali is added to it. Buffers typically involve a weak acid or alkali together with one of its salts.
- **5.** A molecule or other entity that can donate a proton or accept an electron pair in reactions.
- **6.** A measure of acidity or alkalinity of water soluble substances.
