

Biological Bases of Behavior

Across

3. Base of the brainstem; controls heartbeat is responsible for automatic survival

7. The brain's sensory control center located on the top of the brainstem; directs messages to the sensory receiving areas in the cortex and transmits replies to the cerebellum and medulla

8. Tissue destruction. Naturally of experimentally cause destruction of brain tissue

10. A visual display of brain activity that detects radioactive form of glucose goes while the brain performs a given task.

11. Two lima bean sized neural clusters; linked to emotion

12. The oldest part and central core of the brain, beginning where the spinal cord swells as it enters the skull.

13. A neural center located in the limbic system; helps process for storage memories of facts and events.

Down

1. Neural system located below the cerebral hemispheres; associated with emotions and drives.

2. A nerve network that travels through the brainstem into the thalamus and plays a role in controlling arousal.

4. Amplified recording of the waves of electrical activity sweeping across the brain's surface.

5. The little brain at the rear of the brainstem; functions include processing sensory input, coordinating movement output and balance, and enabling nonverbal learning and memory.

6. Small structure helps keep the body's internal environment in a steady state. Controls the pituitary gland.

9. Brain imaging technique that measures magnetic field's from the brain's natural electrical activity.
